## **Syntax**

• Writing a function that returns the range of an array:

```
def find_range(array):
return max(array) - min(array)
```

• Writing a function that returns the mean absolute deviation of an array:

```
def mean_absolute_deviation(array):
    reference_point = sum(array) / len(array)

distances = []
for value in array:
    absolute_distance = abs(value - reference_point)
    distances.append(absolute_distance)
return sum(distances) / len(distances)
```

• Finding the variance of an array:

```
### If the the array is a 'Series' object ###

sample_variance = Series.var(ddof = 1)

population_variance = Series.var(ddof = 0)

### If the array is not a 'Series' object ###

from numpy import var

sample_variance = var(a_sample, ddof = 1)

population_variance = var(a_population, ddof = 0)
```

• Finding the standard deviation of an array:

```
### If the array is a 'Series' object ###

sample_stdev = Series.std(ddof = 1)

population_stdev = Series.std(ddof = 0)

### If the array is not a 'Series' object ###

from numpy import std

sample_stdev = std(a_sample, ddof = 1)

population_stdev = std(a_population, ddof = 0)
```

## Concepts

- There are many ways we can measure the **variability** of a distribution. These are some of the measures we can use:
  - The range.
  - The mean absolute deviation.
  - The variance.
  - The standard deviation.
- Variance and standard deviation are the most used metrics to measure variability. To
  compute the standard deviation and the variance for a **population**, we can use the
  formulas:

<ul> <li>To compute the standard deviation and the variance Bessel's correction to the formulas above:</li> </ul>	for a <b>sample</b> , we need to add the

• <b>Sample variance</b> is the only unbiased estimator we learned about, and it's unbiased only when we sample with replacement.

## Resources

- An intuitive introduction to variance and standard deviation.
- Useful documentation:
  - numpy.var()
  - numpy.std()
  - Series.var()
  - Series.std()
